ICS1526

Video Clock Synthesizer

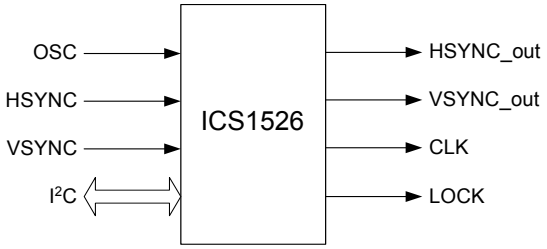
General Description

The ICS1526 is a low-cost, high-performance frequency generator. It is suited to general purpose phase controlled clock synthesis as well as line-locked and genlocked high-resolution video applications. Using ICS's advanced low-voltage CMOS mixed-mode technology, the ICS1526 is an effective clock synthesizer that supports video projectors and displays at resolutions from VGA to beyond XGA.

The ICS1526 offers single-ended clock outputs to 110 MHz. The HSYNC_out, and VSYNC_out pins provide the regenerated versions of the HSYNC and VSYNC inputs synchronous to the CLK output.

The advanced PLL uses its internal programmable feedback divider. The device is programmed by a standard I²C-bus™ serial interface and is available in a TSSOP16 package.

ICS1526 Functional Diagram



Features

- Lead-free packaging (Pb-free)
- Low jitter (typical 27 ps short term jitter)
- Wide input frequency range
  - 8 kHz to 100 MHz
- LVCMOS single-ended clock outputs
  - Up to 110 MHz
- Uses 3.3 V power supply
- 5 Volt tolerant Inputs (HSYNC, VSYNC)
- Coast (ignore HSYNC) capability via VSYNC pin
- Industry standard I²C-bus programming interface
- PLL Lock detection via I²C or LOCK output pin
- 16-pin TSSOP package

Applications

- Frequency synthesis
- LCD monitors, video projectors and plasma displays
- Genlocking multiple video subsystems

Section 1 Overview

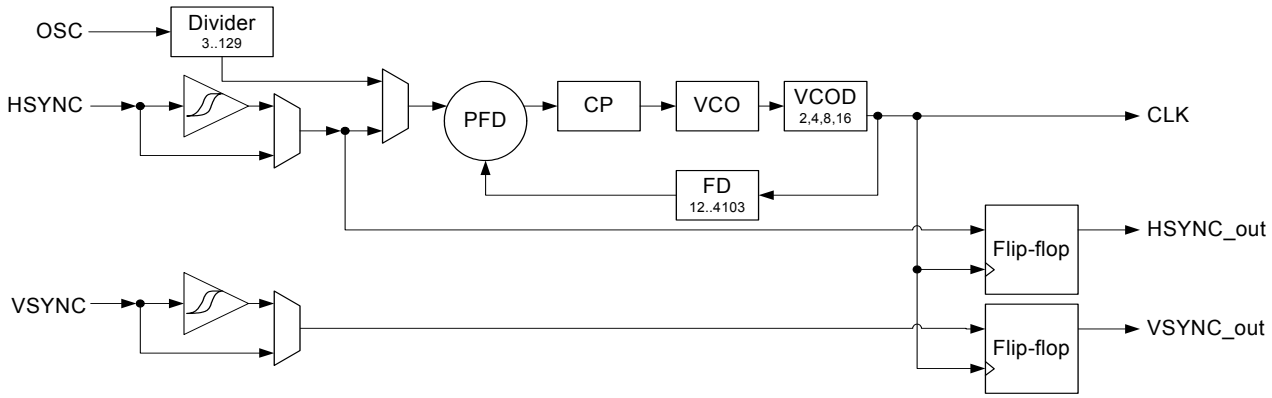
The ICS1526 is a user-programmable, high-performance general purpose clock generator. It is intended for graphics system line-locked and genlocked applications and provides the clock signals required by high-performance analog-to-digital converters.

The ICS1526 has the ability to operate in line-locked mode with the HSYNC input.

1.1 Phase-Locked Loop

The phase-locked loop has a very wide input frequency range (8 kHz to 100 MHz). Not only is the ICS1526 an excellent, general purpose clock synthesizer, but it is also capable of line-locked operation. Refer to the block diagram below.

Figure 1-1 Simplified Block Diagram



Note: Polarity controls and other circuit elements are not shown in above diagram for simplicity

The heart of the ICS1526 is a voltage controlled oscillator (VCO). The VCOs speed is controlled by the voltage on the loop filter. This voltage will be described later in this section.

The VCOs clock output is first passed through the VCO Divider (VCOD). The VCOD allows the VCO to operate at higher speeds than the required output clock.

NOTE: Under normal, locked operation the VCOD has no effect on the speed of the output clocks, just the VCO frequency.

The output of the VCOD is the full speed output frequency seen on the CLK. This clock is then sent through the 12-bit internal Feedback Divider (FD). The feedback divider controls how many clocks are seen during every cycle of the input reference.

The Phase Frequency Detector (PFD) then compares the feedback to the input and controls the filter voltage by enabling and disabling the charge pump. The charge pump has programmable current drive and will source and sink current as appropriate to keep the input and the clock output aligned.

The input HSYNC and VSYNC can be conditioned by a high-performance Schmitt-trigger by sharpening the rising/falling edge.

The HSYNC_out and VSYNC_out signals are aligned with the output clock (CLK) via a set of flip flops.

1.2 Output Drivers and Logic Inputs

The ICS1526 uses low-voltage TTL (LVTTL) inputs and LVCMOS outputs, operating at the 3.3 V supply voltage. The LVTTL inputs are 5 V tolerant.

The LVCMOS drive resistive terminations or transmission lines.

1.3 Automatic Power-On Reset Detection

The ICS1526 has automatic power-on reset detection (POR) circuitry and it resets itself if the supply voltage drops below threshold values. No external connection to a reset signal is required.

1.4 I²C Bus Serial Interface

The ICS1526 uses a 5 volt tolerant, industry-standard I²C-bus serial interface that runs at either low speed (100 kHz) or high speed (400 kHz). The interface uses 12 word addresses for control and status: one write-only, eight read/write, and three read-only addresses.

Two ICS1526 devices can sit on the same I²C bus, each selected by the Master according to the state of the I2CADR pin. The 7-bit device address is 0100110 (binary) when I2CADR is low. The device address is 0100111 (binary) when I2CADR is high. See Section 4, “Programming”

Section 5 AC/DC Operating Conditions

5.1 Absolute Maximum Ratings

Table 5-1 lists absolute maximum ratings for the ICS1526. Stresses above these ratings can cause permanent damage to the device. These ratings, which are standard values for ICS commercially rated parts, are stress ratings only. Functional operation of the ICS1526 at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Table 5-1 ICS1526 Absolute Maximum Ratings

Item	Rating
VDD, VDDA, VDDQ (measured to VSS)*	4.3 V
Digital Inputs	VSS –0.3 V to 5.5 V
Analog Inputs	VSS -0.3 V to 6.0 V
Analog Outputs	VSSA –0.3 V to VDDA +0.3 V
Digital Outputs	VSSQ –0.3 V to VDDQ +0.3 V
Storage Temperature	–65°C to +150°C
Junction Temperature	125°C
Soldering Temperature	260°C
ESD Susceptibility*	> 2 KV**

*. Measured with respect to VSS. During normal operations, the VDD supply voltage for the ICS1526 must remain within the recommended operating conditions.
