

TOSHIBA BIPOLAR LINEAR IC SILICON MONOLITHIC

TA2131FL**LOW CURRENT CONSUMPTION HEADPHONE AMPLIFIER FOR PORTABLE MD PLAYER (WITH BASS BOOST FUNCTION)**

The TA2131FL is a low current consumption headphone amplifier developed for portable digital audio. It is particularly well suited to portable MD players that are driven by a single dry cell. It also features a built-in bass boost function with AGC, and is capable of bass amplification of DAC output and analog signals such as tuner.

An ultra-compact QON package is utilized, enabling sets to be compacted.

QON24-P-0505-0.50

Weight : 0.05 g (Typ.)

Actual product display name : 2131

FEATURES

- Low current consumption : $I_{CCQ}(V_{CC1}) = 0.55 \text{ mA (Typ.)}$
 $I_{CCQ}(V_{CC2}) = 0.20 \text{ mA (Typ.)}$
- Output power : $P_O = 8 \text{ mW (Typ.)}$
($V_{CC1} = 2.8 \text{ V}$, $V_{CC2} = 1.2 \text{ V}$, $f = 1 \text{ kHz}$, $\text{THD} = 10\%$, $R_L = 16 \Omega$)
- Low noise : $V_{no} = -102 \text{ dBV (Typ.)}$
- Built-in low-pass boost (with AGC)
- I/O pin for beep sound
- Outstanding ripple rejection ratio
- Built-in power mute
- Built-in power ON/OFF switch
- Operating supply voltage range ($T_a = 25^\circ\text{C}$) : $V_{CC1} = 1.8\sim 4.5 \text{ V}$
 $V_{CC2} = 0.9\sim 4.5 \text{ V}$

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

FUNCTION EXPLANATION

1. Bass Boost Function

a. Description of Operation

TA2131FL has a bass boost function for bass sound reproduction built-in to the power amplifier. With the bass boost function, at medium levels and lower, channel A and channel B are added for the low frequency component, and output to BST amplifier 2 (BST2) in negative phase. That signal is inverted and added before being subjected to bass boost. If the signal of the low-frequency component reaches a high level, the boost gain is controlled to main a low distortion (see Fig.1).

Fig.1 System Diagram of Bass Boost

b. AGC Circuit

The AGC circuit of the bass boost function detects with "AGC DET" the voltage component created by "BST2," and as the input level increases, the variable impedance circuit is changed, and the bass boost signal is controlled so that it is not assigned to BST amplifier 1. In this way, the bass signal to "BST2" input is shut-off, and that boost gain is controlled.

c. Bass Boost System

As shown in Fig.1, the flow of the bass boost signal is that the signal received from power amplifier input goes through LPF1, ADD amplifier, ATT (variable impedance circuit), BPF1 (BST amplifier 1) and LPF2, and the negative phase signal to the power amplifier input signal is output from BST amplifier 2. The reason why it becomes the negative phase of the BST amplifier 2 signal is that the phase is inverted by 180° in the audible bandwidth by the secondary characteristics of LPF1 and LPF2 in Fig.1.

Ultimately the main signal and the bass boost signal formed before BST2 are added.

Fig.2 shows the frequency characteristics to each terminal.

Fig.2 During Bass Boost (Frequency Characteristics to Each Terminal)

2-1. Low-Pass Compensation Function

In C-couple type power amplifiers, it is necessary to give the output condenser C a large capacity to flatten out the frequency characteristics to the low frequency band (this is because the loss in the low frequency bandwidth becomes larger due to the effect of the high-pass filter comprising C and R_L). Particularly when the headphone load is approximately 16Ω and an attempt is being made to achieve frequency characteristics of $\pm 3 \text{ dB}$ at 20 Hz, a large capacity condenser of $C = 470 \mu\text{F}$ is required.

Bearing this situation in mind, a low-pass compensation function was built in to the TA2131FL, and while reducing the capacity of the output coupling condenser, almost flat ($\pm 3 \text{ dB}$) frequency characteristics in all audible bandwidths (20 Hz to 20 kHz) have been achieved.

Fig.3 shows the low-pass system diagram, and Fig.4 shows the frequency characteristics at each point. In Fig.4, (a) represents the status lost by the low-pass as a result of the high-pass filter comprising the headphone load ($R_L = 16 \Omega$) and the output coupling condenser ($220 \mu\text{F}$) in the C-coupling system.

Fig.3 Low-Pass Compensation System Diagram

Fig.4 Power Amplifier Frequency Characteristics

<Principle of Low-Pass Compensation>

The low-pass component alone is extracted from the composite signal of PWA/PWB output, and that frequency signal is fed back to PWA/PWB once more via the inversion amplifier, thereby making it possible to increase the gain only of the low-pass component. The frequency characteristics of the power amplifier output $V_{(out)}$ in this state are shown in Fig.4 (b). In practice they are the frequency characteristics (c) viewed from load terminal $V(R_L)$, and the low-pass is compensated relative to the state in (a).

2-2. Low-Pass Compensation Condenser and Crosstalk

In this low-pass compensation condenser circuit, processing is carried out using the composite signal of power amplifier output, so this affects crosstalk, according to the amount of compensation.

f characteristics and crosstalk generated by the capacity of the condenser for compensation (8-pin) are shown below.

Fig.5 Condenser and f Characteristics for Low-Pass Compensation

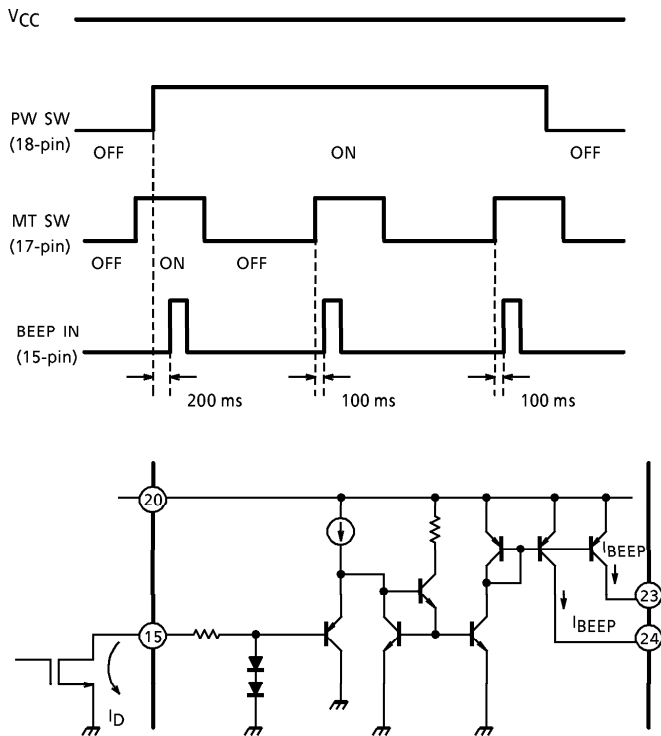

Fig.6 Low-Pass Compensation Condenser and Crosstalk

3. Beep

Beep sound signals from microcomputer can be received by the beep input terminal (15-pin). The PW_A and PW_B of the power amplifier during power mute are turned OFF, and the beep signal input from BEEP-IN (15-pin) is output from the BEEP-OUT terminal (23/24-pin) as fixed current, after passing through the converter and current amplification stage. Connecting this terminal to the headphone load outputs the beep sound.

If the beep sound is not input, fix the BEEP-IN (15-pin) terminal to GND level.

4. Power Switch

As long as the power switch is not connected to V_{CC1} , the IC does not operate. If it malfunctions due to external noise, however, it is recommended to connect a pull-down resistor externally (the power switch is set to be highly sensitive).

5. Threshold Voltages of Switches

| | |
|----------|--------------|
| | PW SW (V18) |
| 'H' | IC operation |
| 'L' OPEN | IC OFF |

| | |
|----------|-------------|
| | MT SW (V17) |
| 'H' | Mute ON |
| 'L' OPEN | Mute reset |

| | |
|----------|--------------|
| | BST SW (V16) |
| 'H' OPEN | BST ON |
| 'L' | BST OFF |

6. These capacitors which prevent oscillation of the power amplifier, and are between the V_{ref} and V_{CC} -GND must have a small temperature coefficient and outstanding frequency characteristics.

MAXIMUM RATINGS

| CHARACTERISTIC | SYMBOL | RATING | UNIT |
|-----------------------|--------------|---------|------|
| Supply Voltage | V_{CC} | 4.5 | V |
| Output Current | I_o (peak) | 100 | mA |
| Power Dissipation | P_D (Note) | 550 | mW |
| Operating Temperature | T_{opr} | -25~75 | °C |
| Storage Temperature | T_{stg} | -55~150 | |

(Note) : Subtract 5.4 mW for each 1°C if used at temperatures greater than 25°C.

ELECTRICAL CHARACTERISTICS

(Unless specified otherwise, $V_{CC1} = 2.8$ V, $V_{CC2} = 1.2$ V, $R_g = 600 \Omega$, $R_L = 16 \Omega$, $f = 1$ kHz, $T_a = 25^\circ\text{C}$)

| CHARACTERISTIC | SYMBOL | TEST CONDITION | MIN. | TYP. | MAX. | UNIT | |

CHARACTERISTICS

(Unless otherwise specified $V_{CC1} = 2.8\text{ V}$, $V_{CC2} = 1.2\text{ V}$, $R_g = 600\ \Omega$, $R_L = 16\ \Omega$, $f = 1\text{ kHz}$, $T_a = 25^\circ\text{C}$)

DISPLAY OF ACTUAL PRODUCT

REQUESTS CONCERNING USE OF QON

Outline Drawing of Package

When using QON, please take into account the following items.

(1) Do not carry out soldering on the island section in the four corners of the package (the section shown on the lower surface drawing with diagonal lines) with the aim of increasing mechanical strength.

(2) The island section exposed on the package surface (the section shown on the upper surface drawing with diagonal lines) must be used as *1 below while electrically insulated from outside.

*1 : Ensure that the island section (the section shown on the lower surface drawing with diagonal lines) does not come into contact with solder from through-holes on the board layout.

- When mounting or soldering, take care to ensure that neither static electricity nor electrical overstress is applied to the IC (measures to prevent anti-static, leaks, etc.).
- When incorporating into a set, adopt a set design that does not apply voltage directly to the island section.
