Baseband delay line**TDA4665****FEATURES**

- Two comb filters, using the switched-capacitor technique, for one line delay time (64 µs)
- Adjustment-free application
- No crosstalk between SECAM colour carriers (diaphoty)
- Handles negative or positive colour-difference input signals
- Clamping of AC-coupled input signals ($\pm(R-Y)$ and $\pm(B-Y)$)
- VCO without external components
- 3 MHz internal clock signal derived from a 6 MHz CCO, line-locked by the sandcastle pulse (64 µs line)
- Sample-and-hold circuits and low-pass filters to suppress the 3 MHz clock signal
- Addition of delayed and non-delayed output signals
- Output buffer amplifiers
- Comb filtering functions for NTSC colour-difference signals to suppress cross-colour.

GENERAL DESCRIPTION

The TDA4665 is an integrated baseband delay line circuit with one line delay. It is suitable for decoders with colour-difference signal outputs $\pm(R-Y)$ and $\pm(B-Y)$.

Notes

1. For SECAM the signal must be blanked line-sequentially. The blanking level must be equal to the non-colour signal. For SECAM, PAL and NTSC the input signal must be equal to the non-colour signal during the internal clamping of TDA4665 (3 to 1 μs before the leading edge of the top pulse of V_5).
2. Noise voltage at $f = 10$ kHz to 1 MHz; $R_S < 300 \Omega$.
3. The leading edge of the burst-key pulse or top pulse is used for timing.
